

Catrinity 1.10

OpenType Features

case (Case Sensitive Punctuation)

If turned on, this feature aligns many punctuation characters with uppercase height instead of lowercase, so that they don't look awkward in all-uppercase text.

ital (Italic)

If turned on, this feature changes several Latin and Cyrillic letters to nicer forms for italic text. It is strongly recommended to only use it in combination with the font style set to italic. Italic text with the ‘ital’ feature turned off will simply use slanted letters instead of special forms (so it’s actually oblique). Applications may or may not trigger ‘ital’ automatically when the font style is set to italic.

kern (Kerning)

This feature adjusts the gaps between the letters to look more even. For example, letters with slanted strokes like A and V need to be closer together than those with vertical strokes like H and N. Kerning is on by default, and there is no good reason to turn it off.

liga (Standard Ligatures)

This feature replaces some letters with ligature glyphs that would otherwise look awkward, for example because of colliding ascenders. It also used to apply the skin tones to the people characters, and for composing the flags from the regional indicators. It is on by default, and there is no good reason to turn it off.

All the ligature glyphs are found in the Code Charts, below the block that the first component belongs to.

locl (Localized Forms)

This feature replaces some letters with localized forms depending on the document's script and language. It is on by default and it should apply the correct letter forms automatically if the rendering programs knows the document's script and language.

mark (Mark Positioning)

This feature cares about the placement of diacritical marks on base letters. It is on by default, and there is no good reason to turn it off.

Due to the huge number of glyphs in Catrinity, not all of them are instructed to work with all marks.

General

These letters and symbols are used for many languages and for mathematical purposes, and can therefore be combined with all the “general” marks from various blocks.

Base letters:

mkmk (Mark To Mark Positioning)

This feature allows stacking diacritical marks. It is on by default, and there is no good reason to turn it off. It works with all the general marks shown above under ‘mark’.

onum (Oldstyle Figures)

If turned on, this feature changes figures from lining (default) style to oldstyle forms.
